

GCN + MLP Forecaster (GCNMLPForecaster, improved fusion) — Architecture

Input	ts projection	MLP block
GCN layer	LayerNorm	Forecast head
Target embedding z	Concatenate	Output

window=30 lookback=30 model_horizon=1 (recursive × 152) GCN(30→32→64) ts_proj=660→64 MLP(256, 128)

Recursive inference loop (repeated 152 times)

append $\hat{y}$ to lookback → rebuild ego-graph → step $t+1$
(repeat 152 times to produce the full horizon)
